# FOREWORD

---

**The new edition of our BIR ferrous report “World Steel Recycling in Figures”, which covers the five-year period between 2008 and 2012, highlights the importance of scrap as a global raw material for the world’s steelworks and foundries.**

---

It is a great pleasure for me to announce the publication of the fourth edition of our “World Steel Recycling in Figures” report.

This compilation of important statistics relating to the global ferrous scrap markets has enjoyed a very positive reception since it appeared for the first time in 2010.

In addition to scrap usage information for the EU, China, the USA, Japan, Russia and Turkey, we have updated our calculation models covering the entire use of steel scrap as a raw material for steelmaking and for global scrap use in iron and steel foundries. According to our figures, global scrap use in steelmaking has been between 440m and 570m tonnes per annum in recent years, while its annual use in iron and steel foundries has amounted to between 56m and 74m tonnes.

We have also provided more information about world trade in steel scrap. For example, we show in a new graph the volume of global steel scrap trade, including inter-EU trade since the year 2000. In addition, we have developed four flow charts relating to steel scrap exports from the USA, the EU-27, Japan and Russia. And we complete our fourth edition of “World Steel Recycling in Figures” with an overview of 2012 export prices for the USA and the EU.

The scale of world trade in steel scrap underlines the need for a free raw materials market. Our industry lives from free trade worldwide, enabling us to bridge the global imbalance between net scrap exporters and net scrap importers.

I would like to extend special thanks to Rolf Willeke, the BIR Ferrous Division's Statistics Advisor, who compiled, prepared and evaluated all the figures in our report which has been extended by some four pages such that it contains a total of 38 graphs and tables – seven more than its predecessor.

For an even more accurate appraisal of the market, we want to continue to improve the steel scrap figures at our disposal, including our quarterly update of world statistics.

We hope that “World Steel Recycling in Figures 2008-2012” will be useful to you in your day-to-day business operations.

Brussels, May 2013

***Christian Rubach***

President of the BIR Ferrous Division

# EXECUTIVE SUMMARY

---

**Final figures for 2012 show a record world steel output and virtually unchanged global steel scrap use for steelmaking.**

---

World crude steel production increased 1.2% in 2012 to a record-breaking 1.547bn tonnes, according to worldsteel. The growth came mainly from Asia and North America while crude steel production fell last year in the EU-27 and South America.

Looking at the main scrap-using countries, worldsteel confirms in our last year's statistics that China's crude steel production reached 716.54m tonnes in 2012 for an increase of 3.1% over the previous year; the country's share of world crude steel production increased from 45.4% in 2011 to 46.3% last year. Other positives include increased crude steel production in the USA (+2.7% to 88.7m tonnes), in Russia (+2.3% to 70.4m tonnes) and in Turkey (+5.2% to 35.9m tonnes). In contrast, there were reductions in crude steel output in the EU-27 (-4.9% to 168.9m tonnes) and in Japan (-0.3% to 107.2m tonnes).

**Global steel scrap use was unchanged at around 570m tonnes in 2012 although developments differed from country to country.**

Regarding global scrap use, we are still dependent on estimates for many areas of the world. So, in collaboration with experts from the German Steel Federation (WV Stahl), we have calculated scrap usage in world steel production of around 570m tonnes in 2012 – unchanged from 2011. Owing to last year's 1.2% increase in world crude steel output, the proportion of steel scrap used in crude steel production fell from 37.3% to 36.8%.

According to our calculations, there was also no change last year in own arisings (circulating scrap) at 200m tonnes. The proportion of own arisings used in crude steel production dropped from 13.1% to 12.9% as a result of mills' efforts to improve yields through the wider use of continuous casting and of near-net-shape casting. For 2012, we have calculated unchanged steel scrap purchases by steelworks at around 370m tonnes.

One of the main reasons why global steel scrap use did not mirror the increase in world steel output last year was the situation in China. As the world's biggest steel producer, China is attracting particular attention regarding its scrap usage; in 2012, its steel industry sharply reduced its scrap usage – by 12.3% to 79.8m tonnes – despite the fact that the country's crude steel production was in positive

territory (+3.1% over 2011). For the Chinese market, iron ore was cheaper for many months last year and so the cost of blast furnace iron was less than steel scrap for many of the country's steelmakers. This assessment is supported by last year's 6.8% growth in global pig iron production to 1.105bn tonnes – an increase which was much higher than the 1.2% gain in world steel output. Chinese steelmakers also benefitted from an increasing domestic scrap supply which caused prices to decline. Together, these facts limited China's need to import steel scrap. This is in line with the insistence of the country's new president Xi Jinping that China will put more into its 'green' efforts, including recycling and low-carbon developments.

The EU-27 recorded a drop in steel scrap usage in 2012 (-6% to 94.1m tonnes) while the region's crude steel production fell by a smaller proportion (-4.9%). The biggest steel scrap user in the EU-27 was Italy on 20.8m tonnes (-5.8%). Also in decline during 2012 was steel scrap consumption in Russia (-4.4% to 20.1m tonnes), even though the country's crude steel production increased 2.3%, and also in Japan (-4.6% to 35.5m tonnes) where crude steel output slipped only 0.3%.

The only major positives in our last year's statistics were the steel scrap usage gains in the USA and in Turkey. The increase in US steel scrap use (+9.4% to 61.7m tonnes) was greater than the growth in domestic crude steel production (+2.7%). A possible explanation for higher steel scrap usage in the USA is the increased use of lower-quality grades by integrated plants as they make use of their ability to dilute residuals in these lesser grades of scrap. Last year's upturn in Turkish steel scrap consumption was around 5.1% to 32.4m tonnes although growth in the country's crude steel production was higher still (+5.2%). But we can assume that in 2012, we also had a higher steel scrap usage in two other big steel producing countries, i.e. India and the Republic of Korea. India increased its steel output (+4.3% to 76.7m tonnes) and steel scrap imports (+32.4% to 8.180m tonnes), and the Republic of Korea increased its steel output (+0.8% to 69.1m tonnes) and steel scrap imports (+17.4% to 10.126m tonnes).

### **Global annual scrap use in iron and steel foundries is between 56m and 74m tonnes**

We are able to present again a calculation model for global scrap use in iron and steel foundries, produced in collaboration with experts from the German Foundry Association (BDG) which is also responsible for the Secretariat General of the European Foundry Association (CAEF). Our calculations cover the period from 2008 to 2011; it was not possible to incorporate figures for 2012 because world casting production

is determined only by US magazine “Modern Casting” with a time lag of one year. It should also be pointed out that our calculation model takes into account the high pig iron usage for casting production in the iron and steel foundries of China and India.

For 2011, we have calculated global scrap usage of 69.7m tonnes for a world iron and steel casting production of 82m tonnes. For the period 2008 to 2011, annual scrap use in iron and steel foundries amounted to between 56m and 74m tonnes. Furthermore, we have calculated annual scrap purchases by the world’s iron and steel foundries at around 43.1m tonnes for 2011.

### **In 2012, Turkey remained the world’s foremost importer of steel scrap whereas China sharply reduced its imports**

In 2012, Turkey’s overseas purchases of steel scrap climbed around 4.5% to 22.415m tonnes to reinforce the country’s position as the world’s foremost importer of steel scrap. As previously stated, it was similarly interesting to note substantially increased imports by the Republic of Korea (+17.4% to 10.126m tonnes) and by India (+32.4% to 8.18m tonnes). Also in positive territory last year were steel scrap imports into Canada (+22.6% to 2.343m tonnes).

China recorded a substantial drop in overseas steel scrap purchases last year (-26.5% to 4.974m tonnes), while declines were also registered by Taiwan (-7% to 4.955m tonnes), the USA (-7.2% to 3.711m tonnes), the EU-27 (-8.1% to 3.412m tonnes), Indonesia (-9.9% to 1.944m tonnes), Malaysia (-11.4% to 1.816m tonnes) and Thailand (-9.4% to 1.701m tonnes).

### **The USA remained the world’s leading exporter of steel scrap in spite of a drop in 2012**

In 2012, there was a decline in US steel scrap exports of around 12.2% to 21.397m tonnes from the high figure of 2011. But in spite of this drop, the USA remained the world’s leading exporter of steel scrap – the biggest buyer of which was Turkey (+13.8% to 6.398m tonnes). It is also worth highlighting a steep decline in US shipments to China (-54% to 1.945m tonnes ) as well as a drop in Canada’s steel scrap exports of around 12.1% to 4.248m tonnes.

Whereas EU steel mills reduced their steel scrap usage, the region's exports jumped 2.1% to 19.214m tonnes in 2012, with Turkey maintaining its position as the biggest buyer of EU steel scrap on 11.05m tonnes (+10.9% over 2011). It is noticeable that, in 2012, Turkey was the biggest buyer of steel scrap for all the main exporting countries of the EU-27. However, there was a sharp decline in EU shipments to China (-37.2% to 0.522m tonnes). The EU-27's internal steel scrap exports last year amounted to around 29.364m tonnes (-6.8% over 2011) – a figure which was clearly higher than shipments to third countries and which confirms the active role of inter-EU trade in the raw materials supply chain for European steel production.

After a difficult 2011, Japan's steel scrap export volumes jumped 57.9% to 8.459m tonnes last year, with shipments to the Republic of Korea soaring 69.9% to 4.862m tonnes. The second biggest buyer of Japan's exports was China on 3.13m tonnes (+28.2% over 2011). Clearly, Japan's exports were positively influenced by favourable short shipping routes. In 2012, higher overseas shipments of steel scrap were also recorded by Russia (+7.6% to 4.349m tonnes), Australia (+28.7% to 2.245m tonnes) and South Africa (+13.6% to 1.436m tonnes).

Our new graph shows that worldwide, total external steel scrap trade reached 106.6m tonnes in 2012 (-1.9% over 2011), of which nearly 28% was attributable to inter-EU trade. It is also noticeable that all the world's leading steel scrap exporters are major net steel scrap exporters: the export surplus was, for example, 17.7m tonnes for the USA and 15.8m tonnes for the EU-27 in 2012.

Meanwhile, the figures for last year also show that steel scrap prices (as illustrated in the export prices of the USA and the EU) remained volatile, thus emphasising that this raw material is an international commodity subject to world market prices.

Finally, market developments in 2012 highlighted the global importance of scrap as an ecologically beneficial raw material for steelworks and foundries, and at the same time underlined the need for a free world raw material market.

**Rolf Willeke**

Statistics Advisor of the BIR Ferrous Division

\* Own Arisings (Circulating Scrap) is the term for lumpy metal remains evolving during the casting process. Elements belonging to this process such as sprues, runners, ingates and feeders are essential to produce a raw casting, but they do not belong to the actual casting and are therefore eliminated during the finishing process of it. Rejects and scrap developing in the foundry are added to the Circulating Scrap as well.
